Novel secreted and transmembrane PRO polypeptides useful for stimulating release of tumor necrosis factor-alpha from human blood and detecting the presence of a tumor in a mammal.

Claim 2; Fig 221; 660pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for

cclon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polympeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PDO Polympeptides or antibodies are used in preparing a condition responsive to the polympeptides or antibodies such as tumours, for stimulating and inhibiting proliferation of midocament for treating a condition responsive to the polympeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for stimulating proliferation of or gene expression in periorte cells, for stimulating proliferation of or gene expression in periorte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating architis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports injuries and onditions which architis and rheumatoid architise. PRO polypeptides such as various thalassaemias and conditions which as sociated disorders such as various thalassaemias and conditions which carbined represents a human PRO polymorlocoide of the invention. This sequence data for this patent is also evaluable in electronic format cor from uspro are sequence contrible of the invention. Onte:

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, or proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for proliferation probes, in chromosome and gene mapping, in generating at this sense RNA and bin gene therapy. The polypuncleotides may also a used in preparing PRO polypeptides by recombinant techniques and in generating either transgenc animals or knock-out animals which are useful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful captains at the PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides of antibodies, such as tumours, for stimulating and inhibiting proliferation of inner expensive to the polypeptides of thuman microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating cells or Tlymphocyte cells, for inducing endothelial cells or as sports cells, for stimulating are useful for treating sports release of proteoglycans trougs bene and/or cartilage disorders such as sports injunities and cells, arthuities PRO polypeptides which stimulate the release of proteoglycans articular cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related solve the proteoglycans are also useful for treating sports-related solve the propertion of the may propose the sequence represents a human 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                           New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, as diagnostic markers for the presence of a disease condition, or as therapeutic targets for treating tumors, diabetes, obesity or arthritis.
                                                                                                                   Gao W;

WPI; 2003-755067/71. P-PSDB; ADB23477. New isolated, secreted and transmembrane PRO nucleic acid, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver tumors.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynuclectides encoding them. The transmembrane polypeptides and the polynuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyce cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynuclectides are useful in molecular biology, including uses as the nutsense RNA and DNA and in gene therapy. The polynuclectides may also antisense RNA and DNA and in gene therapy. The polynuclectides may also continue the development and screening of therapeutically useful generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful casement for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of convascular endothelial cells, for stimulating differentiation of adipocyte cells, for stimulating confideration of or gene expression in pericyte cells, for stimulating confideration of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating arbane and/or cartillage disorders such as sports injunies and variant endothelial cell tube formation and for treating arbane which are well an expression in pericyte cells, for reating cartillage disorders such as sports injunies and endor cartillage disorders such as sports injunies and endor cartillage disorders such as sports injunies. arthritis. PRO polypeptides which simulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note:

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the release of proteoglycans from carcilage, stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the release of a cytokine from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for detecting cells, for stimulating proliferation of endothelial cells, for detecting
                                                                                                                       .;

```
the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in encation of merapeutic agent, pro is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating concerning its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (1) and (11) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis of polypeptide, a method for stimulating the release of tumour necrosis of factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chodioroyte cells and a method for consistent or differentiation of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prosetate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridsation probes, in chromosome and gene mapping, in generating a thypridsation probe, in chromosome and gene mapping, in generating a thissense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by knock-out animals which are custulint the development and screening of knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or of thuman microvascular endothelial cells, for midlating the uptake of gruinlating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating are expression in periore cells, for stimulating calls the proliferation of finner ear utricular supporting cells, for stimulating are useful for treating sports inducing and challed are useful for treating such as sports inducing and conditions which stimulate the release of proteoglycans arthorias are also useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related disorders such as various human endomental is also sequence represents a human . 0 New PRO nucleic acid, useful for producing a recombiannt PRO polypeptide and for manufacturing a medicament for diagnosing or treating tumor. New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, detecting the presence of tumor in a mammal, or modulating the uptake of glucose or free fatty acid by skeletal muscle cells or adipocyte cells.

## Claim 2; Fig 221; 660pp; English

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the cransmembrane) polypeptides (1). (1) is useful for stimulating the uptake of glucose or FFA by skeletal muscle cells adipocyte cells, for calease of FFA by skeletal muscle cells adipocyte cells, for stimulating the proliferation of for gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of Inner ear utilicular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating proliferation of T-lymphocyte cells, for stimulating proliferation of endothelial cells for detecting the rectal, cervical or inhibiting the binding of C A-peptide to factor VIIA, for inhibiting the differentiation, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or are useful for isolating genomic and cDNA nucleotide in chromosome in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding conditions of PRO polypeptide, for generating the absorbance of preparation of PRO polypeptide, for generating the absorbance in a screening of therapeutically useful reagents, in gene therapy, for knockout animals which in turn are useful in the development and conconcent of the proposes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, and for

the presence of tumour in a manmal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligomuclectide probes are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (II) encoding (I) is useful in chromosome of an encoding of the proparation of antisense RNA and DNA, in the preparation of PNO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gone therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PNO, e.g. detecting its expression in specific cells, tissues or serum, and for sources. (I) and (II) are useful for tissue typing this sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                 o

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the transmembrane of TNP-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of of gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of proteoglycans from cartilage, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating of cells, for inhibiting the binding of the release of a cytokine from PBMC cells, for inhibiting the binding of the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stimulating genomic and cDMA nucleotide sequences or the presence of tumour in a mammal. The tumour is lung, colon, breast, contisense probes. (1) is also useful as therapeutic agent probes are useful for isolating genomic and cDMA nucleotide sequences or confidentify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (1) encoding (1) is useful in chromosome fantisense mapping, in generation of proparation of PRO polypeptide, for generating transgenic animals which in turn are useful in the development and screening of therapeutically useful reagents, and for generating probes. An anti-(1)-antibody is useful in diagnostic assays for PRO, concept probes. An anti-(1) are useful for tissues or serum, and for generating confining its expression in specific cells, itssues or serum, and for affinity purification as at conception of PRO from recombinant cell culture or natural concept human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                 3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as incisence RNA and in gene therapy. The polymucleotides may also artisence RNA and the properties by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful usedicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of or gene expression in periotyce cells, for stimulating cells are useful muscle cells or adjocyte cells, for stimulating condition of adjocyte cells, for stimulating cells or tringing cells are useful for treating sports-related joint problems, varinties and are also useful for treating various mammaled are useful for treating various mammaled are useful for treating various mammaled are also useful for treating various mammalian haemoglobing associated disorders such as various thatassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This

(GETH ) GENENTECH INC

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, certification or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating at attiesnee RNA and DNA and in gene therapy. The polymucleotides may also constain in the development and screening of therapeuticalides may also generating either transgenic animals or knock-out animals which are used in preparing PRO polypeptides by recombinant techniques and in caspens. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating differentiation of adipocyte cells, for stimulating of ferentiation of adipocyte cells, for stimulating to the proliferation of adipocyte cells, for stimulating conditions and conditions and conditions and conditions and conditions and conditions and conditions which stimular cartilage are useful for treating various maniform artilage defects, osteoarthritis and rheumacoid arthritis. PRO polypeptides which stimulate scales of protecoglycans articular cartilage defects, osteoarthritis and rheumacoid arthritis. PRO polypeptides which stimulate scales of protecoglycans articular cartilage defects, osteoarthritis and rheumacoid arthritis. Or induces or propagetides which stimulating due to treating various maniform artilage defects, osteoarthritis and rheumacoid arthritis. Or polypeptides are also useful for treating various maniforms and conditions whas benefit from enhanced local immune system cells infilt . 0 Human, secreted and transmembrane protein; PRO; gene; ss;

New secreted and transmembrane PRO polypeptide useful for detecting the presence of tumor in a mammal, or modulating the uptake of glucose or free fatty acid by skeletal muscle cells or adipocyte cells.

## Claim 2; Fig 221; 659pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the upcake of release of TNF-alpha from human blood, for modulating the upcake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of proteoglycans from cartilage, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating proliferation of individual the between cartilages of a cycokine from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes and misense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or

```
knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(1)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (1) and (11) are useful for tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted and transmembrane protein; PRO; gene; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of choindrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the release of proteoglycans from cartilage, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                   Gaps

continuating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the release of a cytokine from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide presence of tumour in a mammal. The tumour of endiences or artisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in apeneration of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or preparation of PRO polypeptide, for generating transgenic animals or chromosome adentification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. effecting the sexpression in specific cells, itssues or serum, and for affinity purification of PRO from recombinant cell culture or natural course. It and (II) are useful for tissue typing. This sequence encodes

New secreted and transmembrane PRO polypeptides, useful in the diagnosis and treatment of cancer. Claim 2; Fig 221; 637pp; English. WPI; 2003-743895/70. P-PSDB; ADB86577. Smith V, 

communication of adoptive cells, for adoptive or grand grand of cells or adoptive cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in periove cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and carthitis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, collypeptides are also useful for treating various mammalian haemoglobin associated disorders such as various thalassacmias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format. The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimmlating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the polypeptides or antibodies or modulation responsive to the polypeptides of the plant of the polypeptides or antibodies, such as tumours, for stimulating and microvascular endothelial cells, for modulating the tells of the public of the polypeptides or antibodies.

cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian hamoglobin associated disorders such as various thalasseamias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence acpresents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                       ö

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prosedre of a tumour in a mammal (e.g. adremal, lung, celon, breast, prostate, rectal, kidney, cervical and liver tumours). The prolynucleotides are useful in molecular biology, including uses as hyprication probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also considerable and DNA and in gene therapy. The polynucleotides may also be used in preparing FNO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapoutically useful reagents. The PRO polypeptides or antibodies are used in preparing a rumours, for antibodies, such as tumours, for stimulating and inhibiting proliferation of such an unsole cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating the proliferation of or gene expression in periorte cells, for stimulating the proliferation of or gene expression in periorte cells, for stimulating the proliferation of or gene expression in periorte cells, for stimulating the proliferation of condition and for treating such as various bone and/or cartilage disorders such as sports injuries and arthritis: PRO polypeptides are luseful for treating various manials and cartilage are useful for treating various manials and cartilage are useful for treating various manials and cartilage are useful for treating various and remanaled in many benefit from enhanced local immune system cell infilteration. This parent sequence data for this patent is also available in electricity of the may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, in chromosome and gene mapping, as chromosome markers, in tissue typing, and in identifying chromosomes.
                                                                                                                                                                                                                                                                                 Beresini M, Daforge L, Desnoyers L, Filvaroff E, Ga

New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver

## Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis

```
proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, widney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating a misses RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating of inferation of almoryte cells, for stimulating proliferation of adipocyte cells, for stimulating proliferation of an edipocyte cells, for stimulating proliferation of inner ear utricular supporting cells, or stimulating colliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating cells, for stimulating darbitis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports related joint problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a human PRO polynucleotide of the invention. Note:
The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other;

New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the profileration or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as this matical probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymuclectides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing of the proliferation of inner endothelial cells, for modulating the uptake of collumnation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tumbe formation and for treating cells, for arthritis bone and/or cartilage are used in prepared portering are useful for treating exports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans continues and contribute are useful for treating apprex: related of our periodic archivities and rhemmaticid archivities. articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-asociated disorders such as various thalasseemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: irom USPTO at segdata.uspto.gov/sequence.html.

New PRO nucleic acid, useful for preparing a composition for treating tumor or for tissue typing.

Claim 2; Fig 221; 637pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the control of the calls or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, constimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of cells, for inhibiting the binding of the release of actor VIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endotherial cells, for stimulating the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stolating genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent, profit ansays to identify other proteins or molecules involved in binding interaction. A polymucleotide (II) encoding (I) is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the correction of therapeutically useful in the development and streams probes. (I) therefore the preparation of therapeutically useful in diagnostic assays for PRO is concover an animals which in turn are useful in the development and streamsome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO concovers. (I) and (II) are inseful in the development and streams probes. (I) and (II) are inseful in the trian main and contained the trian turn and contained the trians and contained the contained and contained the contained and contained the contained and contained the contained and contained and contained the trians and contained the contained and contained the contained and contained the contained and contained the contained and co novel human secreted and transmembrane PRO polypeptide.

                                                                                                                                                   ADC52795 standard; cDNA; 1129
                                                                                                                                                                                                                                                  18-DEC-2003 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US2003087365-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens
                               1129
                                                                                                                                                                                                        ADC52795;
                                                                                                      RESULT 141
                                                                                                                              ADC52795/
                                                                                                                                                        The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, proliferation probes, in chromosome and gene mapping, in generaling to polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating thy prolates may also an incleance and an gene therapy. The polynucleotides may also to be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development as tumours, for stimulating and inhibiting proliferation of man antibodies such as tumours, for stimulating and inhibiting proliferation of such animals and propared of subpocyte cells, for stimulating differentiation of adipocyte cells, for stimulating proliferation of inner as untricular supports related joint stimulating heaptoliferation of inner as untricular supports related joint problems, articular cartilage are also useful for treating various cartilage are also useful for treating various thalasseamias and arthritis. PRO polypeptides which stimulate the release of the problems, articular cartilage defects, osteoathritis and rheumatoid cartilage are also useful for treating various that sequence are research as various cand conditions which may benefit from enhanced local immunesystem cell 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gao W;

PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor New

# Claim 2; SEQ ID NO 221; 637pp; English.

This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation,

This invention relates to novel nucleic acids encoding human PRO secreted

migration or differentiation) is typically governed by information received from other cells and the immediate environment. The information is often transmitted by secreted polyapetides (for example mitoganic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaccutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention proteins, along with the cDNA sequences ancoding them. The novel proteins along with the cDNA sequences ancoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is a cDNA sequence which encodes a human PRO protein of the ö human, PRO, membrane bound protein, membrane bound receptor, cell proliferation; cell migration; cell differentiation; mitogenic factor; survival factor, cytotoxic factor; differentiation factor, necropeptide; hormone; cell receptor; receptor-ligand interaction; cytostatic; chondrocyte; tumour; ss; gene. ```

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The projumuleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating a this same RNA and an gene therapy. The polymucleotides may also colon, breast, prostated and spene therapy. The polymucleotides may also a this same and in gene therapy. The polymucleotides may also consist the PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful.

Complement for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing and inhibiting proliferation of human microvascular andothelial cells, for modulating the proliferation of inner ear unitoulating the uptake of glucose or FRA (free fatty acid) by skeletal muscle cells for stimulating the proliferation of inner ear unitoulate supports injuries stimulating the proliferation of inner ear unitoulate cells or treating various bone and/or cartilage and expression in pericyte cells or treating various bone and/or cartilage disorders such as sports injuries proteoglycans from cartilage disorders such as various thalassaemias and arthritis. PRO polypeptides are also useful for treating various benemial manepulations which may benefit from enhanced local immune system cartilated former inst PRO nucleic acid, useful for preparing a recombinant PRO polypeptide for manufacturing a medicament for diagnosing or treating tumor. infiltration. This sequence represents a human PRO polynucleofide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html. nucleic acid, useful for preparing a recombinant PRO polypeptide manufacturing a medicament for diagnosing or treating tumor. New PRO I

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the projection or differentiation of chondrocyte cells and a method for proliferation or factoring the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polyprofess are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and in gene therapy. The polyprolides may also antisense RNA and in gene therapy. The polyprolides and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful testul in the development and screening of therapeutically useful medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for simulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of

```
glucose or FPA (free fatty acid) by skeletal muscle cells or adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating prolliferation of or gene expression in pericyte cells, for stimulating the prolliferation of inner ear utricular supporting cells or 1-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of prolleng articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias
                                                                                                                                                                                                                                                                                                                                           and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymicleotide of the invention. Note: The sequence date that this patent is also available in electronic format from USPPTO at seqdata.uspto.gov/sequence.html.

in the formation, federate to movel muchen and maintenance of multicellular roles in the formation, differentiation and maintenance of multicellular corganisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information, creceived from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytocoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interpreted by diverse and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the estimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumnor in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumnor associated gene. The present
                                                                                                                                                                                                                                                                                                                                                New PRO nucleic acid, useful for manufacturing a medicament
                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 2; SEQ ID NO 221; 637pp; English.

    in transmembrane proteins Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular croganisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytofocal, differentiation factors, cytofocal, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the proteins of chondroytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or reacting a factoring of the convent of a medicament for measuring or the convent of a membrane base of the convent of a process.
                                                                                                                                                                                                                                                                                                                                                                                         to novel nucleic acids encoding human PRO secreted
                                                                                                                                                                                                                                                                                  nucleic acid, useful for preparing a recombinant PRO polypeptide manufacturing a medicament for diagnosing or treating tumor.

This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintennance of multicellular corganisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information, crecived from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such an receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic activities through the stimulation of chondrocytes. The nucleic activities through the cumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present equence is a cDNA sequence a human PRO protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information is received from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention as in the blocking of receptor-ligand interactions. The current invention may have cytostatic activities through the proteins of the invention may have cytostatic activities through the useful for the manufacture of a medicament for diagnosing or treating a time the manufacture of a medicament for diagnosing or treating a treating at the contract in a manufacture of a medicament for diagnosing or treating a treating at the contract in a manufacture of a medicament for diagnosing or treating a treating and the contract in a manufacture of a medicament for diagnosing or treating a factor of the contraction when the contraction and the contraction is the contraction of the contraction when the contraction is the contraction which is the contraction of the contraction when the contraction is the contraction when the contraction is the contraction when the contraction is the contraction of the contraction when the contraction is the contraction of the contraction when the contraction is the contraction of the contraction contraction contraction contraction contraction contraction contraction contraction contraction contraction contraction contraction contraction contra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

ADD03046;
 This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The face of many individual calls (for example proliferation, organisms. The face of many individual calls (for example proliferation, migration or differentiation) is typically governed by information. Conserved transmitted by secreted polypeptides (for example mitogration is often transmitted by secreted polypeptides (for example mitogration is often transmitted by secreted polypeptides (for example mitogration is often transmitted by secreted polypeptides (for example mitogration is often transmitted by secreted polypeptides (for example mitogration feachors, cytotoxic factors, differentiation factors, or neuropeptides and hormones) which are received and interpreted by diverse call receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the simulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating at tumour in a mammal. In addition, they may be useful for measuring or sequence is a cDNA sequence which encodes a human PRO protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid for use in industrial applications has at least 80 percent nucleic acid sequence identity to nucleotide sequence that encodes amino acid sequence selected from amino acid sequence group.

CC factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for cd etecting the presence of a tumour in a mammal leg, adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as nickediation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are used in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a muticodies, such as tumours, for simulating and inhibiting proliferation of antibodies or stimulating differential cells, for modulating proliferation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for inducing endothalial cells the formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage are also useful for treating sorts injuries arthritis. PRO polypeptides are also useful for treating various cartilage are also useful for treating various cartilage are also useful for treating various cartilage are also useful for treating various cartilage are also useful for treating various cartilage are also useful for treating various cartilage are also useful for treating various infiltration. This sequence represents a human PRO polypucles of the invention. Note: The sequence data for this patent is also available in cells invention. Note: The sequence data for this patent is also available in

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the profess of TWD-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in paricyte cells, for stimulating the proliferation of or gene expression in paricyte cells, for stimulating the release of protecogycans from cartilage, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting of the release of a cytokine from PMMC cells, for stimulating the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothedial cells, for stemulating proliferation of endothedial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or antisense probes (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding in caraction. A polymucleotide (II) encoding (I) is useful in the genemapping, in generation of antisense RNA and DNA, in the preparation of PNO polypeptide, for generating transgenic animals or knocket animals with the contraction of the profess of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (1) and (11) are useful for tissue typing. This sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes. An anti-(1)-antibody is useful in diagnostic assays for PRO,

tumors, New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors such as lung, colon, breast, prostate, rectal, cervical and/or liver

P-PSDB; ADC69458.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the problem or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as nisease RNA and DNA and in gene herapy. The polynucleotides may also antisease RNA and DNA and in gene herapy. The polynucleotides may also carisease RNA and DNA and in gene herapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals of therapeutically useful useful in the development and screening of therapeutically useful cagenerating accompants. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing or antibodies, such as tumours, for stimulating and inhibiting proliferation of or gene expression in pericyte cells, for stimulating colliferation of adipocyte cells, for stimulating colliferation of adipocyte cells, for stimulating colliferation of adipocyte cells, for stimulating colliferation of anticollar supporting cells, for rimulating colliferating endothelial cells considered to an end/or cartilage disorders such as sports injuries and arbuits. PRO polypeptides which stimulate the releases of proteoglyvans or enthilist PRO proteoglyvans considered are useful to reach a sports injuries and arbuits are useful to reach a storts related and the release of proteoglyvans of the proliferation of adipocyte cells, for stimulating subject the proliferation of subject to the proliferation of subject to t from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalessaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The data for this patent is also available in electronic format from the USPTO website at segdata.uspto.gov. sednence

WPI; 2003-844455/78. P-PSDB; ADC48347. New secreted and transmembrane PRO nucleic acids and polypeptides, useful for detecting a tumor, stimulating the release of tumor necrosis factor alpha and stimulating the proliferation of endothelial cells.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the relaese of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the polypeptide, a method for stimulating the factor at the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, in chromosome and gene mapping, in generating a natisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are used in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FFA by skeletal muscle cells for adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for T-lymphocyte

invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis actor—alpha (TWF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as consistence RNA and DNA and in gene therapy. The polynucleotides may also hybridisation probes, in chromosome and gene mapping, in generating either transgenic animals or knock-out animals which are consenting either transgenic animals or knock-out animals which are consenting in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of consential muscle cells for adjocyte cells, for stimulating collevant of inner ear utricular supporting cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endechelial cells, for stimulating and ordiniaring discreases and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, cells, from cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports injuries and conditions which may benefit from enhanced local immune system cell infilteration. This earence represents a human PRO polymolocide of the invention. Note: cells, cells and an also various bene in endored discrete such as various challable in electronic format The sequence data for this patent is also avai from USPTO at seqdata,uspto.gov/sequence.html. 888888888888888888888888888888888888

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the factor-alpha (TNF-alpha) from human blood, a method for stimulating the colon, breast, prostate, rectal, kidney, cervical and a method for clon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and bNA and in gene therapy. The polynuclectides may also contisense in the development and screening of the polymelectides may also sectul in the development and screening of therapeutically useful reagents. The PRO polypeptides by recombinant techniques and in cagenating either transganic animals or knock-out animals which are cagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or condition responsive to the polypeptides or entibodies are used in periotyce cells, for simulating the proliferation of adipocyte cells, for simulating the proliferation of regene expression in periotyce cells or transition and for transition and for transition and for transition and for transition and periotyce reals, for the proliferation of an expense or the proporting cells or transition and many and the proliferation of an expense or the proporting cells or transition and periotyce reals, for the proliferation of an expense or the proporting cells or transition and the proliferation of an expense or the proporting cells or transition of an expense or th treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html.

Human PRO polynucleotide #111.

01-JAN-2004 (first entry)

ADD10913;

1913/c ADD10913 standard; cDNA; 1129

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy. Claim 2; Fig 221; 637pp; English. WPI; 2003-801168/75. P-PSDB; ADC80407

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Baker KP,
```

New secreted and transmembrane PRO nucleic acids and polypeptides, useful for detecting a tumor, stimulating the proliferation or differentiation of chondrocyte cells and stimulating the release of tumor necrosis factor Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeletal muscle cell; adipocyte cell; periovte cell; inner ear utricular supporting cell; T-lymphocyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration. The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the Gao Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, Ga Gerritsen ME, Goddard A, Godowski PJ, Gurney AL, Sherwood S; Smith V, Stewart TA, Tumas D, Watanabe CK, Wood WI, Zhang Z; Claim 2; SEQ ID NO 221; 637pp; English. 03-MAR-2000; 2000US-0187202P. 01-DEC-2000; 2000WO-US032678. 19-DEC-2001; 2001US-00028072. 21-MAY-2002; 2002US-00152399. (GETH ) GENENTECH INC. WPI; 2003-852594/79. P-PSDB; ADDI0914. US2003194774-A1. Homo sapiens. 16-0CT-2003 alpha. The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondroyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, including uses as hybridisation probes, in chromosome and gene mapping, including uses as chypridisation probes, in chromosome and gene mapping, in generating antisense RNA and bNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the cells, for modulating the proliferation of submover cells, for stimulating the proliferation of inner are utricular supporting cells, for stimulating the proliferation of inner are utricular supporting cells, for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint in in

WPI; 2003-844454/78. P-PSDB; ADC47795 New secreted and transmembrane PRO polypeptides and nucleic acids useful for detecting a tumor, stimulating the release of proteoglycans from cartilage and stimulating the proliferation of endothelial cells.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. darenal, lung, detecting the presence of a tumour in a mammal (e.g. adrenal, lung, detecting the presence of a tumour in a mammal (e.g. adrenal, lung, antibology, including uses as a series, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as a set in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing of the properties or antibodies, such as tumours, for antibodies are used in preparing of thuman microvascular endothelial cells, for modulating the uptake of altibodies, such as tumours, for stimulating of the polypeptides or attribodies, such as tumours, for stimulating are used in preparing of finer ear unfamily or eclls, for stimulating the uptake of stimulating of finer ear unfamily or supporting cells, for stimulating the polypeptides are useful for treating sports-related joint problems, arthritis. PRO polypeptides which stimulate the release of protecylycans from cartilage are useful for treating sports-related joint problems, arthritis. PRO polypeptides which stimulate the release of protecylycans framical are also useful for treating sports-related joint problems, arthritis and man and/or cartilage disorders such as sports injuries and also useful for treating sports-related joint problems, are useful for treating sports-related joint problems, associated disorders such as various human menalphore and also useful for treating sports-relate from USPTO at segdata.uspto.gov/sequence.html.

2003-852595/79. WPI; 2003-852595 P-PSDB; ADD09324 New secreted and transmembrane PRO nucleic acids and polypeptides, usefu for detecting a tumor, stimulating the release of tumor necrosis factor alpha from blood and stimulating the release of proteoglycans from

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene fherapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in

or in

```
generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of glucose or PRA by skeletal muscle cells, for adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating the uptake of proliferation of orgene expression in perioyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and carthritis. PRO polypeptides which stimulate the release of protecylycans from cartilage are useful for treating sports-related joint problems, arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the crelases of INF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating proliferation of adipocyte cells, for stimulating proliferation of modutelial cells, for stimulating cells, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of modutelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent, proliferation of in assays to identify other proteins or molecules involved in binding in nersense probes. (1) is also useful as therapeutic agent, in chromosome and gene mapping, in generation of antisense process or chrocosome identification, as chromosome marker, and for generating transgenic animals or chromosome identification, as chromosome marker, and for generating cor probes. An anti-(1)-antibody is useful in diagnostic assays for PRO, erg. chromosome identification of PRO from recombinant cell culture or natural correcting its expression in specific cells, tissue syptomy, and (11) are useful for tissue syptomy, pluming and (11) are useful for tissue syptomy, and (11) are second and transmembrane PRO polymorial and transmembrane PRO polymorial and transmembrane PRO polymorial and transmembrane PRO polymorial and transmembrane PRO polymorial and transmembrane PRO polymorial and transmembrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, gene; ss, PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; xidney; cervix; liver; microvascular endothelial cell; glucose; FRA; skeletal musole cell; adipocyte cell; perioyte cell; inner ear utricular supporting cell; proficyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; profesolyvan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWR-alpha) from human blood, a method for stimulating the polypeptide, a method for stimulating the release of tumour necrosis of proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating cartisenses RNA and in gene therapy. The polymucleotides may also a trisense RNA and in gene therapy. The polymucleotides may also color be used in preparing PRO polypeptides by recombinant techniques and in the development and screening of knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful structured to treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of summore ear utricular supporting cells, for stimulating differentiation of adipocyte cells, for stimulating the proliferation of inner ar utricular supporting cells, for stimulating the proliferation of inner ar utricular supporting cells, for stimulating differation of inner ar utricular supporting cells, for medication and for treating various bone and/or cartilage disorders such as sports injuries and cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related joint problems are useful for treating sports-related joint problems are useful for treating spo
                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for detection of tumors, modulating the uptake of glucose or free fatty acids and stimulating the release of proteoglycans from cartilage.
                                                                                                                                                                                                                                                                Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, G.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, useful in chromosome and gene mapping, in generating antisense RNA and DNA, and in the treatment of cancer.

# Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the

```
proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polyunclectides are useful in molecular biology, including uses as antisense RNA and NNA and in gene therapy. The polyunclectides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or knock-out animals which are capents. The PRO polypeptides or knock-out animals which are medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of number of the proliferation of adipocyte cells, for stimulating the uptake of stimulating or firminating cells, for stimulating colliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating cells, for indiving endothelial cell tube formation and for treating articular cartilage defects, osteoarthritis and for treating collipsing collipsing are useful for treating various mammalian haemoglobing associated disorders such as various thelasseamias and conditions which may be entitled for treating various mammalian haemoglobing sequence encodes a human PRO polypeptide of the invention. Note: The sequence catter for this patent is also available in electronic format from conditions and a process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted and transmembrane protein; PRO; gene; ss;

or in New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.

2; SEQ ID NO 221; 659pp; English. Claim

The invertion describes 305 nucleic acids encoding FVC (secreted and release of TNF-alpha from human blood, for modulating the uptake of allocation or differentiation of chondrocyte cells, cor stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of proteoglycans from cartiage, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating proliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting the prostate, rectal, cervical or liver tumour. The oligonucleotide probes cells, for inhibiting the probes cells, for inhibiting the probes cells, for inhibiting the probes cells, for inhibiting the defecting in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (II) encoding (I) is useful in the development and some propers or propers in turn are useful in the development and some conception in turn are useful in diagnostic assays for PRO, e.g. chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum and certain are expression in specific cells, tissues or serum and certain and cells are are expression in specific cells, tissues or serum and cells are are also and serum and cells, tissues or serum and cells are are also and serum and cells. The invention describes 305 nucleic acids encoding PRO (secreted novel human secreted and transmembrane PRO polypeptide.

WPI; 2003-852597/79. P-PSDB; ADD51624. New secreted and transmembrane PRO nucleic acids and polypeptides, useful for detecting the presence of a tumor, stimulating the release of tumor necrosis factor alpha from human blood and treating, e.g. organ failure.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for coll, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, in generating antisense RNA and brook polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful antibodies, such as tumours, for attimulating and inhibiting proliferation of funces or FRA by skeletal muscle cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating collieration of funce and adipocyte cells, for stimulating effect or gene expression in pericyte cells, for stimulating and condition as sports injuries and cartinage defects, observativities and rhemmatoid arthrities PRO polypeptides which stimulate the release of proteoglycan cartinage defects, observativities and rhemmatoid arthrities and seculated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infilteration. One sequence encodes a human PRO polypeptide of the invention. Note: The reproportion of sequence encodes a human PRO polypeptide of the invention. One is a seculation of sequence encodes a human PRO polypeptide of the invention of the propertion of seq

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polypucletides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TRP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for according to proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The plynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for

proliferation of or gene expression in pericyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating cells, for stimulating cells, for inducing endothelial cell tube formation cells, Inner ear utricular supporting cells or I-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of protegglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin—associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence date for this patent is also available in electronic format form methods.
                                                                                                                                                                                                                                                                                                                                                                                           .

generating antisense RNA and DNA, and in gene therapy

Claim 2; Fig 221; 637pp; English 

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polypucleotides encoding them. The invention also melbods and the polypucleotides encoding them. The invention also melbod for stimulating the polypeptide, a method for stimulating the polypeptide, a method for stimulating the profile from human blood, a method for stimulating the profileration or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colin, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating and in gene therapy. The polymucleotides may also antisense RNA and in gene therapy in polymucleotides may also generating either transgenic animals or knock-out animals which are useful in the development and exceening of therapeutically useful captures. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of aluge or stimulating and inhibiting proliferation of stimer expression in periotyce cells, for stimulating proliferation of adipocyte cells, for stimulating various bene and/or cartilage disorders such as sports injuries and cartilage are useful for treating sports related joint problems, articular cartilage defects, osteoarthriks as sports injuries procession expension the such as sports injuries and cartilage are useful for treating sports related joint problems, articular cartilage defects, osteoarthrikis and rheumatoid architics. PRO polypeptides which stimulate the release of proteoglycans articular cartilage are useful for treating sports related joint problems, as sociated disorders such as various thalassemias and conditions which may benefit from enhanced l from USPTO at segdata.uspto.gov/sequence.html.

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the criedase of INF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation of or gene expression in perioryte cells, for stimulating the proliferation of or gene expression in perioryte cells, for stimulating the proliferation of inner ear utricular supporting cells, cor stimulating the proliferation of inner ear utricular supporting cells, cor stimulating the proliferation of inner ear utricular supporting cells, cor stimulating proliferation of inner ear utricular supporting cells, cor stimulating proliferation of endothelial cells, for stimulating the prostate, rectal, corvical or inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, corstate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cond to inching sequences or antisense probes. (I) is also useful as therapeutic agent, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the properation of RNO polypoptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating conditions. An anti-condition is useful in diagnostic assays for RNO, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. (I) and (II) are useful for tissue typing. This sequence encodes

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation of chondrocyte cells and a method for proliferation probes. The mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidatey, cervical and invertumours). The colon, breast, prostate, rectal, kidatey, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating colon, breast, propoptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating the proliferation of adipocyte cells, for stimulating and inhibiting proliferation of adipocyte cells, for stimulating are useful for treating sports related joint problems, articular cartilage are useful for treating sports related joint problems, articular cartilage defects, osceoarthriles and rheumatoid atthering cartilage are useful for treating various mammalian haemoglobin-and/or cartilage are useful for treating various mammalian haemoglobin-and/or artilage are useful for treating various per propertion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.
tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeletal muscle cell; adipocyte cell; periote cell; inner ear utricular supporting cell; periote cell; endochelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, G

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

# Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for cecting the presence of a tumour in a mammal (e.g. adrenal, lung, considering the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and bNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or autibodies, such as tumours, for stimulating and inhibiting proliferation of of human microvacular nucle cells or adipocyte cells, for stimulating cells or timulating cells or proliferation of inner ear utricular supporting or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating

```
various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteogyycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPIO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted and transmembrane protein; PRO; gene; ss; Tumour necrosis factor alpha release; TNT-alpha release; glucose uptake modulator; endulator; PFA uptake modulator; cell proliferation stimulator; cell differentiation stimulator; cell differentiation stimulator; cell differentiation inhibitor; cytokine release stimulator; tumour; clup tumour; cloon tumour; breast tumour; prostate tumour; rectal tumour; cervical tumour; chromosome mapping; gene mapping; gene therapy; chromosome identification; chromosome marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of INF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various and/or cartilage disorders, e.g. arthritis.
                                                                                                                                                                                                                                                                                                                      Gaps

colls, for stimulating the proliferation of or gene expression in pericyce cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of finner ear utricular supporting cells, for stimulating the proliferation of finner ear utricular supporting cells, for stimulating the broliferation of finner ear utricular supporting cells, for stimulating the broliferation of endothelial cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes center is claring genomic and cDNA nucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful an assays to identify other proteins or molecules involved in binding interaction. A polynucleotide (II) encoding (I) is useful in the preparation of PRO polypeptide, for generating transgents animals or knockout animals which in turn are useful in the development and chromosome identification, as chromosome marker, and for generating probes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, itssues or serum, and for affinity purification of PRO from recombinant cell culture or natural sour anovel human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·.

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

# Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blod, a method for stimulating the proliferation of differentiation of chondrocyte cells and amethod for proliferation of aliferentiation of chondrocyte cells and amethod for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular blology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RAM and DNA and in gene therapy. The polynucleotides may also catistical in the development and screening of therapeutically useful reagents. The PRO polypeptides by knock-out animals which are generating either transgenic animals or knock-out animals which are medicament for treating a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating of the proliferation of or gene expression in pericyte cells, for stimulating to the proliferation of anexes ear urricular supporting cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating antihities and finer ear urricular supporting cells, for inducing endochelial cell tube formation and for treating crocartilage are useful for treating sports injuries and conditions which associated disorders such as various thalassaemias and conditions which may benefit from enhance date of the invention. Note: The sequence encodes a human PRO polypeptide of the inventions of the invention. Note: The condition conditions are also useful for treating each encodes a human PRO polypeptide of the inventions and provide of the invention. the USPTO website at segdata.uspto.gov.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an artichody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prosition or differentiation of chondrocyte cells and a method for detecting the presence of atumour in a meamal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as chybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for
                                                                                                                                                                                                                                                                                                                Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostace; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeletal muscle cell; adipocyte cell; pericyte cell; inner ear utricular supporting cell; T-lymphocyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gao W;

stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, polypeptides are also useful for treating sports-related joint problems, polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format from the USPTO website at segdata.uspto.gov.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FPA; skeletal muscle cell; adipocyte cell; perioyte cell; inner ear utricular supporting cell; T-lymphocyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

                                                                                                                                                                                                                                                                                                                                                                                              20-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-NOV-
             The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention albo an method for stimulating the propriet of conductory cells and a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for proliferation probes, in chromosome and gene mapping in generating colls, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping in generating colls and the development and screening of therapeutically useful and evelopment and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful cuseful in the development of stimulating and inhibiting and inhibiting and medicament for tracting a condition responsive to the polypeptides of stimulating differation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting on and for artilage disorders such as sports righted proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage disorders which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, associated disorders such as various thalassaemis and relation. The may benefit from enhanced local immune syst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; trumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; PRA; skeletal miscle cell; adipocyte cell; glucose; PRA; inner ear utricular supporting cell; pericyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports alpiury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

Gao W;

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; SEQ ID NO 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the problem to relate the transment of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as thybridisation probes, in chromosome and gene mapping, in generating antisense RNA and bNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are caspents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing coll human microvascular endothelial cells, for modulating the stimulating coll for stimulating differentiation of inner ear utricular supporting cells, for stimulating proliferation of inner ear utricular supporting cells, for inducing endochelial cells for modulating cells, for inducing endochelial cells are supporting cells, for inducing endochelial cells, for modulating carting are useful for treating sports related joint problems, articular cartilage are useful for treating sports related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. Problems associated disorders such as various thalassaemias and conditions which

```

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, lung, coll, breast, prostate, rectal, kidney, cervical and liver tumours). The colynucleotides are useful in molecular biology, in generating to polymucleotides may also constituted by an expensive to the prolifeds may also constituted by the presence of the properties of hybridisation probes, in chromosome and gene mapping, in generating coll preparing prolypeptides by recombinant techniques and in this ensetul in the development and screening of the prolypeptides or antibodies are used in preparing of condition responsive to the polypeptides or antibodies, such as tumours, for stimulating of interacting a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endochelial cells, for medilating the uptake of stimulating differation of another and such an adipocyte cells, for stimulating collication of another are useful for medilating the proliferation of inner ear utricular such as sports injuries and articular cartilage are useful for treating various mammalian hammedlobin. Collicated are useful for treating various mammalian hammedlobined are also useful for treating various mammalian hammedlobined are also useful for treating various mammalian hammedlobined as various thalassaemias and condition. The sequence terpresents as various thalassaemias and condition. The sequence represents a various thalassaemias and condition. The sequence represents a human PRO polymedeced than. Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis. 3 Gao Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, G: Gerritsen ME, Goddard A, Godowski PJ, Gurney AL, Sherwood S; Smith V, Stewart TA, Tumas D, Watanabe CK, Wood WI, Zhang Z; Claim 2; SEQ ID NO 221; 636pp; English. ```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the crelease of TNF-alpha from human blood, for modulating the uptake of glucose or FFA by skeletal muscle calls or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or spane expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, cor stimulating proliferation of for the binding of the release of a cycokine from PBMC cells, for stimulating cells, for stimulating cells, in the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for stimulating cells, in the differentiation of adipocyte cells, for stimulating sproliferation of endothelial cells, for stimulating center tumour. The oligonucleotide probes cells, for stimulating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding contensation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and certification, as chromosome marker, and for generating creening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating correcting in statioday is useful in diagnostic assays for PRO, a probes. (1) and (11) are useful in diagnostic assays for PRO, a probes contend and transmented the forganerating cells, in generating of the cells and transmented the forganerating and the appendix and forganerating and the propertical and the propertion of PRO in the propertion of PRO in the properties or setum, and 
cell differentiation inhibitor; cytokine release stimulator; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; cervical tumour; chromosome mapping; gene mapping; gene therapy; chromosome identification; chromosome marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Deforge L, Desnoyers L, Filvaroff E, G. Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; SEQ ID NO 221; 636pp; English

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the

cc release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of condrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, con stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for stimulating of the presence of tumour in a mammal. The tumour is lung, colon, breast, professed, cervical or liver tumour is lung, colon, breast, colon, breast, colon, breast, colon, breast, colon, breast, colon, breast, and servical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA mucleotide sequences or antisense probes. (I) is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding increaction. A polymicleotide (I) is encoding (I) is useful in chromosome and gene mapping, in generation of antisense RNA and DNA, in the conformation of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating conforms one identification, as chromosome marker, and for generating conformation of the properties of sources. (I) and (II) are useful in diagnostic assays for PRO, encombinant cell culture or natural conformation of PRO from recombinant cell culture or natural conformation than an uncell in diagnostic sequence encodes a novel human secreted and transmembrane PRO polypeptide. ö Gaps ô 1.1%; Score 21.4; DB 1; Length 1129; 66.0%; Pred. New PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor, for chromosome mapping or for tissue 2003-875867/81. P-PSDB; ADD79871.

3 Gao

Claim 2; Fig 221; 638pp; English.

typing

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for celecting the presence of a tumour in a mammal (e.g. adrean), lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polyuncleotides are useful in molecular biology, including uses as hybridasation probes, in chromosome and gene mapping, in generating antisense RNA and bin gene therapy. The polyuncleotides may also constrained either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of therapeutically useful.

Complement for treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of mandochelial cells, for medilating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of inner ear utricular supporting cells or T-lymphocyte cells, for medicing endochelial cells or adipocyte cells, for stimulating and or gene expression in periors cells, for stimulating are useful for treating sports injuries and articular cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related joint problems, articular encodes a human PRO polypeptide of the invention. Note: The sequence encodes a human PRO polypeptide of the invention.

cof human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells. for stimulating differentiation of adipocyte cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endothelial cell tube formation and for treating carious bone and/or cartilage disorders such as sports injuries and arthitis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, or polypeptides are also useful for treating sports-related joint problems, propagated disorders such as various thalasseemias and conditions which may benefit from enhanced local immune system cell infiltration. This captured data for this parent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone

the invention relates to isolated number FKO puppetides (secreted and the propertied) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the relates of themour necrois and the polymucleotides are amethod for stimulating the presence of a tumour in a meanmal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The publication probes, in chromosome and gene mapping, in generating the presence of a tumour in a mammal (e.g. adrenal, lung, publication probes, in chromosome and gene mapping, in generating attients probe polypeptides by recombinant techniques and in attients RNA and bNA and in gene therapy. The polymucleotides may also attients RNA and bNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or attibodies, such as tumours, for stimulating and inhibiting proliferation of the proliferation of adipocyte cells, for stimulating of human microvascular endothelial cells or adipocyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for treating endothelial cell tube formation and for
                                                                                                                The invention relates to isolated human PRO polypeptides
and/or cartilage disorders, e.g. arthritis.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNR-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for coloribrate, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also antisense RNA and DNA and in gene therapy. The polynucleotides may also consistent transgenic animals or knock-out animals which are usedin in the development and screening of therapeutically useful reagents. The PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are usedicament for treating a condition responsive to the polypeptides or antibodies; such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for stimulating differentiation of adipocyte cells, for stimulating colliferation of animal expension in periovice cells, for stimulating proliferation of animal expension in periovice cells, for stimulating colliferation of animal endothelial cells or adipocyte cells, for stimulating colliferation of animal animal colliferation of animal animal subporting cells or treating proliferation of animal animal subporting cells or treating cartilage defects, osteodicaments and continues and continues and continues and continues and continues and continues and conditions which associated disorders such as sports injuries and associated disorders such as various thalasseamias and conditions when the former expression in perior cells, in a polar or the propertion of any phenefit from enhanced local infimume system cells i Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis. is also available in electronic format Gaps Gao Filvaroff E, Gao AL, Sherwood S; ·.                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the projuce to a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and in gene therapy. The polymucleotides may also the useful in the development and screening of the polymucleotides may also constituted the properties of the properties of the section are the properties of the section are section and screening of the polymecotides may also section the development and screening of therapeutically useful are eagers. The PRO Polymeptides of the polymecotides of antibodies are used in preparing a condition responsive to the polymeptides or antibodies are used in preparing a condition responsive to the polymeptides or antibodies are used in preparing of the proliferation of inner expression in periotyte cells, for stimulating the proliferation of inner expression in periotyte cells, for stimulating collicration of inner expression in periotyte cells, for stimulating collicration of inner expression in periotyte cells, for stimulating collicration of or agene expression in periotyte cells, for stimulating cells are useful for treating sports-related joint problems.

C cells, for inducing endothelial cell tube formations and artifices and artificals are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rhematoid arthritis. PRO polypeptides which stimulate the release of proteoglycan articular cartilage are useful for treating various mannalian hammologicated disorders such as various prodessing are useful for treati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

(GETH ) GENENTECH INC

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for detecting the presence of tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidhey, cervical and liver tumours). The polymucleotides are useful in molecular bloicgy, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also consecular in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are generating either transgenic animals or knock-out animals which are medicament for treating arcening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for midpodies are used in hisbiting proliferation of inner ear unricular or proliferation of of inner ear unricular supporting cells, for inducing endothelial cells, for modulating the upcase of proliferation of inner ear urricular supporting cells, for inducing endothelial cells, for modulating the proliferation of inner ear urricular supporting cells, for inducing endothelial cells of such as sports injuries and cells, for inducing endothelial cell the release of proteoglycans from cartilage defects, osteoarthitis and rheumatoid arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage defects, osteoarthitis and rheumatoid arthritis in PRO polypeptides which stimulations cells, for may benefit from enhance of sequence repre Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis. 3 Gao Deforge L, Desnoyers L, Filvaroff E, G. A, Godowski PJ, Gurney AL, Sherwood S; Tumas D, Watanabe CK, Wood WI, Zhang Z;

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hypridisation probes, in chromosome and gene mapping, in generating hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are generating either transgenic animals or knock-out animals which are reagents. The PRO polypeptides or antibodies are used in preparing a reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or

ō New isolated, secreted and transmembrane PRO polypeptides and acids, useful for the diagnosis, prevention and/or treatment o

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention albe an include which specifically binds to a PRO polypeptide, a method for stimulating the factor-alpha (TWP-alpha) from human blood, a method for stimulating the presence of a tumur in a mammal (e.g. adrenal, lung, colin, breast, prostate, rectal, kidney, cervical and liver tumours). The colymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating colon, breast, prostate, propolypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are generating either transgenic animals or knock-out animals which are useful in the development and screening of therapy. The polypeptides or antibodies are used in preparing a medicament for tracating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating coliferation of inner ear uricular supporting cells, for inducing endothelial cells or adipocyte cells, for stimulating effects and useful for treating sports-related joint problems, archidas are useful for treating sports-related joint problems, archidas are useful for treating sports-related joint problems, archidas are useful for treating sports-related joint problems, archidas a human PRO polypeptides and manaled local immune system cell infiltration. Note: The sequence encodes a human PRO polypeptide of the invention. Note: The Expense of production of sequence and a human pro polypeptide of the inspect of the propertion of sequence and a human encodes a human pro polypeptide of the inspect of prop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Novel human secreted and transmembrane protein PRO4327 cDNA. BP. ADE32714 standard; cDNA; 1129 29-JAN-2004 (first entry) ADE32714; RESULT 189 ADE32714/c 

Human; secreted and transmembrane protein; PRO; gene; ss; Tumour necrosis factor alpha release; TNR-alpha release; glucose uptake modulator; prA uptake modulator; cell proliferation stimulator; cell differentiation stimulator; cell differentiation inhibitor; cytokine release stimulator; tumour; colon tumour; breast tumour; protestet tumour; rectal tumour; cervical tumour; chromosome mapping; gene mapping; gene therapy; chromosome identification; chromosome marker.

Homo sapiens

US2003194766-A1

```
The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (1). (1) is useful for stimulating the criesase of TNF-alpha from human blood, for modulating the uptake of glucose or FFRA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating proliferation of T-1ymphocyte cells, for stimulating cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the binding of the presence of tumour in a mammal. The tumour is lung, colon, breast, cells, for stimulating genomic and cDNA nucleotide sequences or are useful for isolating genomic and cDNA nucleotide sequences or antisense probes. (1) is also useful as therapeutic agent. PRO is useful or inseastion of PRO polypeptide, for generating transgenic animals or concour animals which in turn are useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in the development and screening of therapeutically useful in diagnostic assays for PRO, ergebecting its expression in specific cells, tissues or serum, and for sentence encodes the faithfication of PRO from recombinant cell culture or natural contracts. (1) and (11) are useful in researce or natural encodes.
                                                                                                                                                                                                                                                                                                                                                                          Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes

WPI; 2003-900161/82. P-PSDB; ADE42407 Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 221; 636pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the proliferation of chondrocyte cells and a method for proliferation of differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as antipolastion probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymuclectides may also colon preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a metibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeltal muscle cells, for stimulating cells, for stimulating cells, for stimulating cells, for inducing endothelial cells, for modulating the uptake of strious bone and/or cartilage disorders such as sports injunies and arthritis. PRO polypeptides which stimulate the release of proteoglycans or arthritis. PRO polypeptides which stimulate the release of proteoglycans cells, for inducing endethelial cell the formation and for treating various bone and/or cartilage disorders such as sports injunies and arthritis. PRO polypeptides which stimulate the release of proteoglycans cells, for inducing endethelial cells the properties of proteoglycans or arthritis. PRO polypeptides which stimulate the release of proteoglycans are also useful for treating sports-related joint problems, ascendants a human PRO polymorione cells, for enarching endethelial cel USPTO at segdata.uspto.gov/sequence.html.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful canequicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of anipocyte cells, for stimulating che proliferation of inner ear usticular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating che proliferation of inner ear usticular supporting cells, for stimulating che proliferation of since and arrival as sports injuries and arrhitis. PRO Polypeptides which stimulate the release of proteoglycans containing and carthitis and carthitis and cartilage disorders such as sports injuries and arrhitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalasseamias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invantion. Note: The sequence data for this patent is also available in electronic format from
                                                 New PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor, for chromosome mapping or for tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the USPTO website at segdata.uspto.gov.

WPI; 2003-900158/82. P-PSDB; ADD89451 Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, certification probes, in chromosour and newhod for polynucleotides are useful in molecular biology, including uses as colynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also consist in preparing PRO polypeptides by recombinant techniques and in reagents. The PRO polypeptides by recombinant techniques and in reagents. The PRO polypeptides by recombinant techniques and in reagents. The PRO polypeptides or antibodies are used in preparing condition responsive to the polypeptides or antibodies, such as tumours, for attibudiating of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing condition responsive to the polypeptides or antibodies, such as tumours, for stimulating of therapeutically useful colluding antibodies, such as tumours, for stimulating or the polypeptides or cells, for stimulating the uptake of stimulating of finer ear utricular supporting cells, for stimulating cells for stimulating cells, for inducing endothelial cells, for modulating the uptake of stimulating cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycan cells, for inducing endothelial cell tube formation and for treating colludar attributes and secular second second cartilage disorders such as sports injuries and conditions which associated disorders such as various bane and/or cartilage are useful for treating sports related joint problems. The sequence represents a human PRO polypurione The sequence data for this patent is also avai from USPTO at seqdata.uspto.gov/sequence.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.
from cartilage are useful for treating sports-related joint problems, atticular cartilage defects, osteoarthritis and rheumatoid arthritis. PRC polypeptides are also useful for treating various mammalian baemoglobin-associated disorders such as various thalasaeamias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The equence data for this patent is also available in electronic format

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for simulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3

proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as colon, breast, and DNA and in gene therapy. The polynucleotides may also antisense RNA and DNA and in gene therapy. The polynucleotides may also consistence RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgence and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the proliferation of adipocyte cells, for stimulating collection of stimulating and inhibiting proliferation of inner ear utricular supporting cells, for stimulating consideration of inner ear utricular supporting cells, for stimulating consideration of inner ear utricular supporting cells, for stimulating consideration of inner ear utricular supporting cells, for inauting and childing sports related of joint problems, articular cartilage are useful for treating sports related of joint problems, articular cartilage defects, osteoatthritis and rheumatoid arthritis. Proliferated disorders such as various thatasseamias and conditions which may benefit from enhanced local immune system cell infiltration. Note: consumption at earlier a human PRO polymolectide of the invention. Note: consumption at earlier and an and an analyse and an and an analyse and an and an and an analyse consideration and an analyse and an analyse and an also available in electronic format from the profile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                from USPTO at seqdata.uspto.gov/sequence.html.

Human PRO polynucleotide #111.

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the CC factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, collecting the presence of a tumour in a mammal (e.g. adrenal, lung, collecting the presence of a tumour in a mammal (e.g. adrenal, lung, collecting the presence of a tumour in a mammal (e.g. adrenal, lung, collecting the presence of a tumour in the constant of the polymucleotides may also polymucleotides are useful in Achomosome and gene mapping, in generating chertaing either transgenic animals or knock-out animals which are useful in the development and screening of therapeutical which are useful in the development and screening of therapeutical which are useful in the development and screening of therapeutically which are considered in the development and screening of knock-out animals which are consecuted in the development and screening of knock-out animals which are consecuted in the development and screening of knock-out animals which are the propagatides or antibodies are useful in preparing a tumours, for stimulating of the prolympetides or antibodies are used in preparing a condition responsive to the polympetides or attribuding and inhibiting proliferation of stimulating and inhibiting proliferation of stimulating the proliferation of inference are supported cells or tradition and provide cells for inducing endothelial cell tube formation and for traditing various bone and/or cartilage defects, osteoarthritis and rhemmacoid for problems, articular cartilage are also useful for treating sports related joint and arthritis. PRO polypeptides which may be a unann PRO polympetide are al

## WPI; 2004-008956/01. P-PSDB; ADD76407.

New PRO nucleic acid, useful for recombinantly producing a PRO polypeptide and for manufacturing a medicament for diagnosing or treating a tumor.

## Claim 2; Fig 221; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polyuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymuclectides may also be used in preparing PRO polypeptides by recombinant techniques and in

```
generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are useful in proparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the man microascular endochelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating the proliferation of orgene expression in periove cells, for stimulating the proliferation of inner ear untricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and carthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, associated disorders such as various thalassaemias and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1129 BP; 231 A; 369 C; 335 G; 194 T; 0 U; 0 Other;

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or cancer

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO prolypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the prolypeptides of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polyprodes are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also the useful in the development and screening of therapeutically useful cuseful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful andicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human miscovascular endothelial cells, for modulating the uptake of glucose on FRA by skeletal muscle cells, for adipocyte cells, for stimulating the proliferation of or gene expression in perioyte cells, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endothelial cell tube formation and for treating variation bone and/or cartilade disorders such as sports injuries and continued to the proless of proliferation of a proless of arthuitis. PRO polypetides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems. Atticular cartilage defects, osteoarthitis and rheumatond arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobinassociated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This from esquence represents a human PRO polymucleocide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also antisense RNA and DNA and in gene therapy. The polynucleotides may also generating either transgenic animals or knock-out animals which are used in preparing PRO polypeptides or knock-out animals which are used in the development and screening of therapeutically useful captument for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of or gene expression in pericyte cells, for stimulating collecation of or gene expression in pericyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating collieration of or gene expression in pericyte cells, for stimulating collieration of anipocyte cells, for stimulating collieration of anipocyte cells, for stimulating collieration of anipocyte cells, for stimulating endochelial cell tube formation and for treating colliers are useful or artifage disorders such as sports injuries and arthiris. PRO polypeptides which stimulate the release of proteoglyvans of the prolieration of the prolieration and for treating content of the prolieration of the prolieration and for treating content of the prolieration of the prolieration of the prolieration and for treating columns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  from cartilage to seeinly control to the seeinly sports related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRC polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                          Deforge L, Desnoyers L, Filvaroff E, Ga

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for certification or differentiation of chondrocyte cells and a method for certification or differentiation of chondrocyte cells and a method for certification broase, in chromosome and gene mapping, including uses as chybridisation probes, in chromosome and gene mapping, in generating antisense RNA and bnNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful.

C useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by Skeletal muscle cells, for adipocyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FPA; skeletal muscle cell; adipocyte cell; periovte cell; inner ear utricular supporting cell; T-lymphocyte cell; endothelial cell tube formation; bone disorder; cartilage disorder; sports injury; proteoglycan; articular cartilage defect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration. New secreted and transmembrane PRO polypeptide and nucleic acid encoding it, for use in gene therapy, as diagnostic markers for the presence of a disease condition, or as therapeutic targets for treating tumors, diabetes, or arthritis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobinassociated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; gene; ss; PRO; secreted polypeptide; transmembrane polypeptide; tumour necrosis factor-alpha; TNF-alpha; chondrocyte cell; tumour; cancer; adrenal; lung; colon; breast; prostate; rectum; kidney; cervix; liver; microvascular endothelial cell; glucose; FFA; skeletal muscle cell; adipocyte cell; periove cell; inner ear utricular supporting cell; T-lymphocyte cell; sports injury; proteoglycan; articular cartilage disorder; sports injury; proteoglycan; articular cartilage dect; osteoarthritis; rheumatoid arthritis; haemoglobin-associated disorder thalassaemia; immune system cell infiltration.

cc polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the problemation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also consistent in the development and screening of therapeutically useful creagent in the development and screening of therapeutically useful creagents. The RNO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of furner endothehalial cells, for modulating the uptake of glucose or FFA by skeletal muscle cells, for addipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating colleration of inner ear utricular such as sports injuries and cells, the proliferation of for gene expression in pericyte cells, for stimulating content of inner ear utricular such as sports injuries and arthritis. PRO polypeptides which stimulate the release of protecolly arthritis. PRO polypeptides which stimulate the release of protecollar arthritis. PRO polypeptides which stimulate the release of protecollar arthritis and nematical cell for treating sports-related joint problems, arthritis penetic from cartilage defects, ostecarthritis and rheumatoid arthritis. PRO polypeptides are useful for treating various mammalian haemoglobin-associated disorders such as various thalassemias and conditions which sequence encodes a human PRO polypeptide of the invention. Note: The Sequence date for this patent is also available in electronic format from the colones a human PRO polypeptide of the invention. N
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a.PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human.Dlood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as thyridisation probes, in chromosome and gene ampping, in generating charter ansigning and the polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in seful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of all minds and all properties or antibodies of the polypeptides or all properties or antibodies of the polypeptides or antibodies of the polypeptides or antibodies or antibodies cells, for modulating the uptake of all minds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     stimulating differentiation of adipocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, polypeptides are also useful for treating sports-related joint problems, polypeptides are also useful for treating various mammalian haemoglobinasticular cartilage such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format from the USPIO website at seqdata.uspto.gov.

New secreted and transmembrane nucleic acid useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome, or cancer.

Claim 2; Fig 221; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adream) lung, or proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adream) lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hypridisation probes, in chromosome and gene mapping, in generating antisense RNA and BNA and in Gene therapy. The polymuclectides may also be used in preparing RNO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful.

CC persecting either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful.

CC reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or attribodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of slucose or FPA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating and confirming the proliferation of or gene expression in periopte cells, for stimulating the proliferation of funer ear utricular supporting cells or Tlymphocyte cells, for inducing endothelial cell the formation and for treating various mannal cartilage are useful for treating sports injuries and articular cartilage are useful for treating sports-related joint problems, articular cartilage are useful for treating sports-related joint proble

be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of glucose or FPA by skeletal muscle cells, for stimulating the uptake of proliferation of or gene expression in periotte cells, for stimulating proliferation of inner ear utricular supporting cells, for stimulating to the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating carbinates and arthritis. PRO polypeptides are useful for treating sports-related joint problems, articular cartilage disorders such as sports injuries and articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence tepresents a human PRO polymucleotide of the invention. Note:

The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        osteoarthritis;

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prosence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and brook polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies such as tumours, for stimulating and inhibiting proliferation of funce or stimulating and inhibiting middle proliferation of or gene expression in pericyte cells, for stimulating the proliferation of adoptore cells, for stimulating effected in of adoptore cells, for stimulating effected in cell tube formation and for treating various bene and/or cartilage disorders such as sports injuries and carthritis and shemmed effects of prolipeptides are useful for treating sports-related joint problems, articular cartilage defects, osteoarthitis and rhemmatoid arthritis. PRO polypeptides which stimulate the release of proteoglycan arthritis and member and success such as various thalassaemias and conditions which may benefit from enhanced local immune system cells in filteration. One of the sequence represents a human PRO polypeptides or a limit problems, articular cartilage are also useful for treating various mammalian hamoglobin. The propose of the propertion of the propertion of the propertio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated PRO polypeptide useful for treating diabetes, hyperhypo-insulinemia, sports injuries, arthritis, obesity, stroke, heart attack, various coagulation disorders, tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                    Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, Ga

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 or PRO4978, for use in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymicleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the release of tumour necrosis proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating cartisenses RNA and bin gene therapy. The polymuclectides may also a hybridisation probes, in chromosome and gene mapping, in generating cartisenses RNA and should name therapy. The polymuclectides may also be used in preparing PRO polypeptides by recombinant techniques and in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful as tumours, for stimulating or inhibiting proliferation of antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or thuman microvascular endothelial cells, for middlating the uptake of glucose or FRA by skeletal muscle cells, for middlating differentiation of alphocyte cells, for stimulating differentiation of alphocyte cells, for stimulating differentiation of alphocyte cells, for stimulating and confidence cells, for inducing endothelial cell tume as sports injuries and arritular cartilage are useful for treating sorts-related joint problems, articular cartilage are useful for treating various manalent may benefit from enhanced local immune system cell infilteration. This sequence represents a human PRO polymuclecti

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWF-alpha) from human blood, a method for stimulating the polypeptide, a method for stimulating the factor-alpha (TWF-alpha) from human blood, a method for stimulating the profileration or differentiation of choadrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The profileration probes, in chromosome and gene mapping, in generating antisense RNA and pNA and in gene therapy. The polyuncleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals of therapeutically useful reagents. The PRO polypeptides by recombinant techniques and in generating either transgenic animals of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of number of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating condition responsive cells, for stimulating condition expression in pericyte cells, for stimulating conditions are useful for treating sports injuries and various bone and/or cartilage disorders such as sports injuries and cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides of the prolypeptides are useful for treating various memalian haemoglobin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel secreted and transmembrane polypeptides, PRO useful for t
bone disorders, arthritis, heart attack, injuries, tumors, and
stimulating release of TNF-alpha from human blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 2; SEQ ID NO 221; 638pp; English.

The invention discloses a human factor VII polypeptide, or a variant or derivative of it, where an amino acid has been modified. This change results in a polypeptide with the same or an increased activity when compared to recombinant wild type human Factor VIIa. Blood coagulation of the haemostation of process is mediated by the formation of a complex between tissue factor or process is mediated by the formation of the Pactor VII zymogen). This complex and Factor VIIa (the active form of the Factor VII zymogen). This complex activates Factors IX and X, converting prothrombin to thrombin, which activates Factors IX and X, converting prothrombin burst. The activates Factors of III leading to a full thrombin burst. The corpusion of activates factor VII zymogen to fibrin resulting in formation of a fibrin clot. The Factor VII zymogen to fibrin tesulting in formation of a fibrin clot. The Factor VII zymogen to fibrin the ability of the Factor VII polypeptide to activate plasma factor X or IX. The factor VII derivative is useful for preparing a medicament for the treatment of beenophilia A or B and for inhibiting thrombus formation. The inactivated factor VII derivatives are useful for treating intimal hyperplasia, restenosis, cardiogenic emboli, platelet deposition the hyperplasia, restenosis, andiogenic emboli, platelet deposition cancer, tumour metastasis, angiogenesis, ischaemia/reperfusion, adult crespiratory distress syndrome (ARDS) and myocardial infarction. The inactivated human coagulation Factor VII polypeptide
Novel factor VII polypeptide, its derivatives useful for preparing medicament for treating bleeding episodes, or for enhancing normal hemostatic system, especially for treating hemophilia.
                                                                                                            Disclosure, Page 82-85; 96pp, English

The invention describes an isolated murine polymucleotide (1) comprising a contiguous stretch of at least 60 mucleotides of one of 265-677 curdeotide 891 ownInDawk gene trapped sequences (GTSB) (S), given in the specification. The novel genes and development of new therapeutic and diagnostic agains and methods. (I) is useful in functional genomic of diagnostic agains and methods. (I) is useful for identifying the coding regions of the murine genome, to isolate cDNAs, genomic clones, or full-length genes/polymucleotides or homologues, heterologues, paralogues, or crhologues that are capable of hybridising to one or more of the GTSs under stringent conditions. (I) can be incorporated into a phage display system that can be used to screen for protectins, or other ligands, that are capable of binding an amino acid sequence encoded by an coligonucleotide or polymucleotide sequence encoded by an expression, colidonucleotide or polymucleotide sequence in at least one of the TS sequences. (I) is useful in addressable arrays, such as gene chips, to identify and characterise temporal and tissue specific gene expression, to identify and characterise temporal and tissue specific gene expression, colidonucleotides or proteins encoded by (I) is useful for treating development computations such as antisense inhibition and gene targeting. Decreasing the level of expression of (I) and/or down regulating the activity of peptides or proteins encoded by (I) is useful for treating development and cell differentiation disorders, adjug, cancer, autoimmune disease, considered and degenerative disorders. This sequence represents a murine cDNA isolated using gene trap
                                                                                                                                                                                                                                  Novel murine polynucleotides that individually identify novel genes into which a retroviral gene trap vector has integrated, useful in genomic analysis and in discovery, development of therapeutic and diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 305 BP; 72 A; 96 C; 66 G; 70 T; 0 U; 1 Other;

```
The present sequence describes a purified corn tassel-derived polymucleotide sequence (cdps) comprising a nucleic acid sequence color polymucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL7683. The cdps sequences concode corn tassel-derived polypeptides (CDPs). The cdps sequences (C encode corn tassel-derived polymeptides (EDPs). The cdps sequences (I) can be used for determining altered gene expression, to recover concode corn tassel-through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, complete traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to clone regulatory elements for use in transformation vectors, to express a polypeptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid determine thomology of known sequences, as probe for use in Southern or Northern hybridisation, and to identify the presence of and/or to consume the degree of similarity between two (or more) nucleic acid
                                                                                                                                                                                                                                              Novel purified corn tassel-derived polynucleotide useful for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 21.1; DB 1; Length 286;

EST clone EA90.

1543 GCTTCTTGTACCTTGATAGGCATCTCTTTCTCAAGGTTAGGAAATTTTTCTTTTTGGTT 1602 The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities heematopoiesis regulating activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, haemostatic and thrombolytic activity, receptor/ligand activity, atti-inflammatory activity, cacherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene therapy ö 243 GAIGCAITGACCICAAACACICICICAGIAICCCAITICIGIIGGAITICITICICAAIC 184 New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries. human; Bovine; ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding. Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (SENP). The present sequence is one mind probe. The SENPs are defived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          X S X E X E X E X S X S X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated IMPD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule compising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 1512 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or the omblement of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid sequences or the complementary nucleic acid sequences or the complementary nucleic acid sequences or the molecule obtained from the bovine cell or tissue. The detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for level or pattern of the molecule in the predictive of the later sequence mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:

                                                                                                                                                                                           genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  251 AATTICTTICCTCCTCTCCTCTCTCTCTCCCGTTCTAGCTCCCCGCTTTTTCCAGTTG 192
                                                                                                                                                                                                                                                                              The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placente. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New spatially-addressable set of single exon nucleic acid probes, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1614 ATTITCCCTGCTTTTGACCTGCCTTCCCTTCCTCTATTCCTTTGGTTTTTGCATAG 1673
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
